

## Intermolecular Forces Practice Problems

1. Rank the following substances by increasing polarity and intermolecular forces.

- a) HF, BF<sub>3</sub>, KF, F<sub>2</sub> \_\_\_\_\_
- b) Na<sub>2</sub>O, CO<sub>2</sub>, CO, O<sub>2</sub> \_\_\_\_\_
- c) PCl<sub>3</sub>, BCl<sub>3</sub>, LiCl, Cl<sub>2</sub> \_\_\_\_\_

2. What is the strongest intermolecular force present in each of the following substances?

- a) Hydrogen Fluoride (HF) \_\_\_\_\_
- b) Sodium Oxide (Na<sub>2</sub>O) \_\_\_\_\_
- c) Phosphorus Trichloride (PCl<sub>3</sub>) \_\_\_\_\_
- d) Oxygen Gas (O<sub>2</sub>) \_\_\_\_\_

USE THE VSPER STRUCTURES BELOW TO ANSWER THE FOLLOWING QUESTIONS:

3. H<sub>2</sub>Se or H<sub>2</sub>O: Which substance will have the highest boiling point and why? \_\_\_\_\_

\_\_\_\_\_

4. CO or CO<sub>2</sub>: Which substance will have the lowest melting point and why? \_\_\_\_\_

\_\_\_\_\_

5.  $\text{H}_2\text{O}$  or  $\text{H}_2$ : Which substance will have the highest surface tension and why? \_\_\_\_\_

\_\_\_\_\_

6.  $\text{NaCl}$  or  $\text{Cl}_2$ : Which molecule will have the lowest vapor pressure and why? \_\_\_\_\_

\_\_\_\_\_

7.  $\text{H}_2\text{O}$  or  $\text{HCl}$ : Which substance will have the highest viscosity and why? \_\_\_\_\_

\_\_\_\_\_

8. List each substance, shown in the image above, in order of increasing intermolecular forces. If two molecules have the same IMF, the one with more MASS will have greater IMF properties.

Weakest IMF ..... Hydrogen Gas ( $\text{H}_2$ )

(Lowest Mass)

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

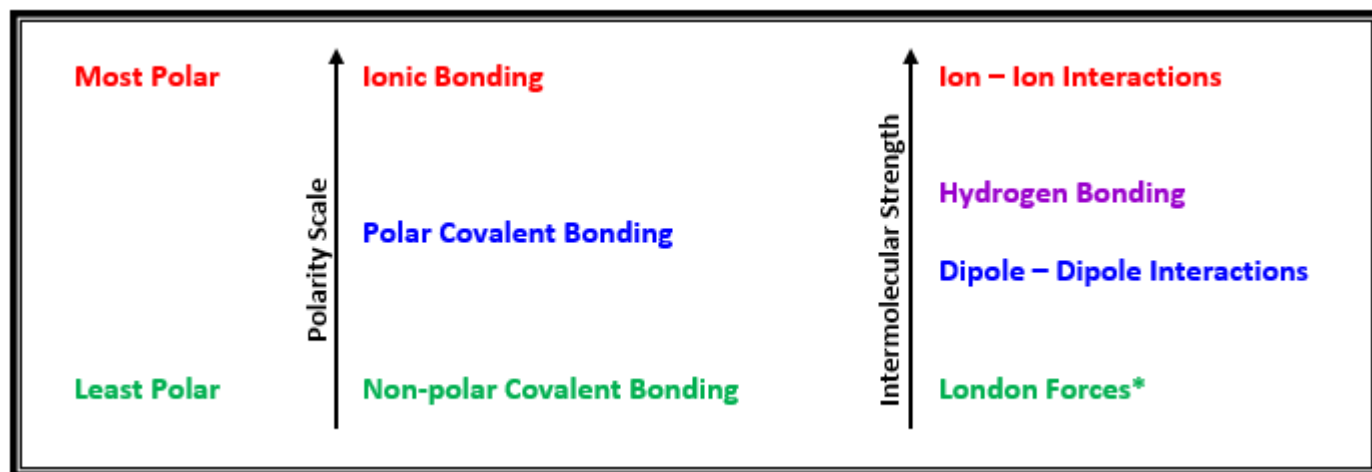

\_\_\_\_\_

\_\_\_\_\_

Strongest IMF ..... Sodium Chloride ( $\text{NaCl}$ )

(Ions are most polar)

## Intermolecular Forces

\*London Forces are also called Dispersion Forces and Induced Dipole Interactions

### Physical Properties depend on Intermolecular Forces!

- The **stronger** the force, the \_\_\_\_\_ the **melting point**.
- The **stronger** the force, the \_\_\_\_\_ the **boiling point**.
- The **stronger** the force, the \_\_\_\_\_ the **viscosity** (resistance to flow).
- The **stronger** the force, the \_\_\_\_\_ the **surface tension** (resistance to increase in surface area.)
- The **stronger** the force, the \_\_\_\_\_ the **vapor pressure** (partial pressure of vapor above a liquid at a certain temperature).

**London Forces are the weakest** because there are \_\_\_\_\_ internal attractive or repulsive forces within a non-polar covalent molecule. Instead, as one molecule approaches another, there is an instantaneous and \_\_\_\_\_ shift in electron distribution due to slight \_\_\_\_\_ forces. This causes an \_\_\_\_\_ dipole which allows the molecules to temporarily be attracted to one another.

**Dipole – Dipole Interactions are not caused by ionic charges!** In Dipole – Dipole Interactions the covalently bonded molecules are sharing the electrons \_\_\_\_\_ causing dipoles to form. As a result, the more \_\_\_\_\_ side of one molecule aligns with the more \_\_\_\_\_ side of another molecule of the same substance. Unlike the London Forces, the dipoles in this situation are \_\_\_\_\_.

**Hydrogen Bonding is a special type of Dipole –Dipole Polar Covalent Bonding.** Hydrogen bonding has an increased intermolecular strength because the hydrogen has an \_\_\_\_\_. So when it forms a covalent bond, it's almost as if it becomes a \_\_\_\_\_, allowing it's one valence electron to be completely pulled away by the greater electronegativity of the \_\_\_\_\_, \_\_\_\_\_, or \_\_\_\_\_ atom.

**Ion – Ion Interactions are the result of ionic charges!** Ionic compounds are made up of a \_\_\_\_\_ that \_\_\_\_\_ its outer electrons to become a positive ion (\_\_\_\_\_) and a non-metal that \_\_\_\_\_ the outer electrons to become a negative ion (\_\_\_\_\_). These ions work like the poles on a magnet to create \_\_\_\_\_ and \_\_\_\_\_ forces aligning the ions within the compound.
