

**Define the following**

- Element \_\_\_\_\_
- Compound \_\_\_\_\_
- Homogeneous mixture \_\_\_\_\_
- Heterogeneous mixture \_\_\_\_\_

**Latin Element Symbols**

- |                |                   |                  |
|----------------|-------------------|------------------|
| • Gold _____   | • Mercury _____   | • Antimony _____ |
| • Silver _____ | • Potassium _____ | • Tin _____      |
| • Copper _____ | • Sodium _____    | • Iron _____     |

**Elements vs Compounds**

- \_\_\_\_\_ is the symbol for the element \_\_\_\_\_.
- \_\_\_\_\_ is the formula for \_\_\_\_\_.
- \_\_\_\_\_ is the formula for \_\_\_\_\_.

**Law of Definite Composition**

Compounds *always contain the same elements in a* \_\_\_\_\_.

Example: Calculate the percent composition of each element in water, H<sub>2</sub>O. (Show your work)

**Molecule**

A \_\_\_\_\_ chemical composed of two or more \_\_\_\_\_ atoms.

- Examples of molecules with **different elements**: \_\_\_\_\_
- Examples of **diatomic elements**: \_\_\_\_\_
- Examples of **allotropes**: \_\_\_\_\_

**Law of Multiple Proportions**

When elements can combine in different ways to form different compounds, they always do it in \_\_\_\_\_ ratios.

- Examples: Theobromine - **C H N O** and Vitamin B<sub>3</sub> - **C H N O**
- \_\_\_\_\_ are used to represent compounds and molecules.
- \_\_\_\_\_ equal number of atoms for each element
- \_\_\_\_\_ International Union of Pure and Applied Chemistry naming system

## Ionic Bonding

Ionic Bonding occurs when a \_\_\_\_\_ atom \_\_\_\_\_ valence electrons to a \_\_\_\_\_ atom to form a \_\_\_\_\_.

- Metal atoms \_\_\_\_\_ electrons to become \_\_\_\_\_.
- Nonmetal atoms \_\_\_\_\_ electrons to become \_\_\_\_\_.

## Properties of Ionic compounds

- \_\_\_\_\_ lattice
- \_\_\_\_\_ melting points
- \_\_\_\_\_ vapor pressure
- \_\_\_\_\_
- \_\_\_\_\_ conductors
- \_\_\_\_\_ solutions

## Lattice Energy

According to Coulomb's Law, the \_\_\_\_\_ the charges the \_\_\_\_\_ the force. So as atoms get smaller, the ionic bond gets stronger and requires \_\_\_\_\_ energy to break apart.

**Practice Problems:** Use the image below to compare the physical and chemical properties of each ionic bond.

- (a) The lattice energy of NaCl is \_\_\_\_\_ than CsCl
- (b) A bond between Ca and F is \_\_\_\_\_ than a bond between Na and Cl
- (c) The melting point of KBr is \_\_\_\_\_ than LiF

## Oxidation Numbers

- Stand for the \_\_\_\_\_ based on the number of \_\_\_\_\_ lost or gained.
- Label the oxidation numbers for Groups 1, 2, 13, 15, 16, 17, and 18 on the portion of the periodic table shown below:

Period																		
	Group 1																	Group 18
	1																	2
	1																	18
2	1	2	Transition Elements										13	14	15	16	17	18
3	Li 3 Lithium	Be 4 Beryllium											B 5 Boron	C 6 Carbon	N 7 Nitrogen	O 8 Oxygen	F 9 Fluorine	Ne 10 Neon
4	Na 11 Sodium	Mg 12 Magnesium	3	4	5	6	7	8	9	10	11	12	Al 13 Aluminum	Si 14 Silicon	P 15 Phosphorus	S 16 Sulfur	Cl 17 Chlorine	Ar 18 Argon
5	K 19 Potassium	Ca 20 Calcium	Sc 21 Scandium	Ti 22 Titanium	V 23 Vanadium	Cr 24 Chromium	Mn 25 Manganese	Fe 26 Iron	Co 27 Cobalt	Ni 28 Nickel	Cu 29 Copper	Zn 30 Zinc	Ga 31 Gallium	Ge 32 Germanium	As 33 Arsenic	Se 34 Selenium	Br 35 Bromine	Kr 36 Krypton

## Net Charge = ZERO

- When \_\_\_\_\_ ions attract, their charges \_\_\_\_\_.

Examples: Fill in the rest of the examples based on Presentation Slide #20.

Reactants	Ionic Bond	Compound Name
$1 \text{ Na}^{+1} + 1 \text{ Cl}^{-1} \rightarrow$	$\text{Na}_1\text{Cl}_1$	sodium chloride

## Transition Metals

- Transition Metals have \_\_\_\_\_ oxidation states because of the \_\_\_\_\_ electrons in the \_\_\_\_-orbital.
- The IUPAC naming system assigns \_\_\_\_\_ to indicate their \_\_\_\_\_.

Examples:

Reactants	Ionic Bond	Compound Name

## Polyatomic Ions

- \_\_\_\_\_ molecules that form an \_\_\_\_\_ charge.
- College Prep must memorize the following:

$\text{NH}_4^{+1}$	Ammonium	$\text{CO}_3^{-2}$	Carbonate
$\text{OH}^{-1}$	Hydroxide	$\text{SO}_4^{-2}$	Sulfate
$\text{NO}_3^{-1}$	Nitrate	$\text{PO}_4^{-3}$	Phosphate

- Honors students must memorize the following:

$\text{NH}_4^{+1}$	ammonium	$\text{MnO}_4^{-1}$	permanganate
$\text{NO}_3^{-1}$	nitrate	$\text{C}_2\text{H}_3\text{O}_2^{-1}$	acetate
$\text{NO}_2^{-1}$	nitrite	$\text{CO}_3^{-2}$	carbonate
$\text{O}_2^{-2}$	peroxide	$\text{HCO}_3^{-1}$	bicarbonate
$\text{OH}^{-1}$	hydroxide	$\text{SO}_4^{-2}$	sulfate
$\text{CN}^{-1}$	cyanide	$\text{SO}_3^{-2}$	sulfite
$\text{ClO}_4^{-1}$	perchlorate	$\text{CrO}_4^{-2}$	chromate
$\text{ClO}_3^{-1}$	chlorate	$\text{Cr}_2\text{O}_7^{-2}$	dichromate
$\text{ClO}_2^{-1}$	chlorite	$\text{PO}_4^{-3}$	phosphate
$\text{ClO}^{-1}$	hypochlorite	$\text{PO}_3^{-3}$	phosphite

Examples: Fill in the table below based on Common Polyatomic Ionic Bonds

Reactants	Ionic Bond	Compound Name
$1 \text{ Na}^{+1} + 1 \text{ HCO}_3^{-1} \rightarrow$	$\text{NaHCO}_3$	sodium <b>bicarbonate</b>

## Covalent Bonding

- Occurs when two or more \_\_\_\_\_ atoms \_\_\_\_\_ valence electrons to form a \_\_\_\_\_.
- Generally, follows the \_\_\_\_\_, because most atoms want \_\_\_\_\_ valence electrons.
- Some common examples:

Ammonia **NH<sub>3</sub>**      Water **H<sub>2</sub>O**      Methane **CH<sub>4</sub>**      Carbon Dioxide **CO<sub>2</sub>**
